Art Unit: 1743

DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

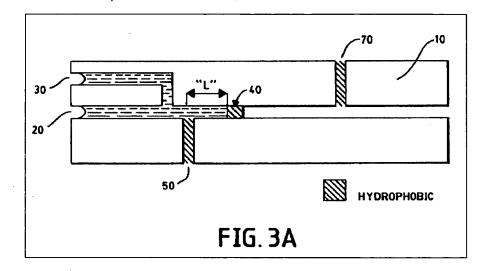

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 1. Claims 1, 2, 9, 10, 60 63, 65 71 and 97 are rejected under 35 U.S.C. 103(a) as being unpatentable over Handique (U.S. Pat. No. 6,130,098 A) (hereinafter "Handique").

Regarding claims 1 and 97, Handique teaches an apparatus comprising: a chamber (e.g., the region to the right of hydrophobic region 40) having an inflow channel (20), wherein the channel comprises a hydrophobic region (40) (see col. 14, lines 24 – 64; figure 3A). In addition, as shown in figure 3A, a hydrophobic surface coating is located within the entirety of a side channel (50) to the main channel (20). Absent any mechanical or pneumatic fluid pressure transport means, this hydrophobic coating would also prevent the inflow of aqueous sample fluid into the inflow channel (20). The use of hydrophobic surface coatings to facilitate effective sample fluid flow control within microfluidic devices is well known in the art (see MPEP §

Application/Control Number: 09/937,690

Art Unit: 1743

2144.03). Therefore, it would have been obvious to a person of ordinary skill in the art to incorporate a hydrophobic inner surface with the inflow channel to facilitate effective sample fluid flow control. Handique teaches the fabrication of the disclosed microfluidic device using different materials, including surface treatment coatings, that would constitute different wall materials (see, e.g., col. 17, line 44 – col. 18, line 39; col. 20, line 5 – col. 21, line 33).

Regarding claim 2, Handique teaches microchannel dimensions of between 0.5 μ m to 50 μ m in depth (see col. 7, lines 44 – 63).

Regarding claims 10 & 60 - 62, Handique teaches an apparatus comprising: a chamber (e.g., the region to the right of hydrophobic region 40) having an inflow channel (20), wherein the channel comprises a hydrophobic region (40) (see col. 14, lines 24 - 64; figure 3A).

Regarding claim 9, Handique teaches the incorporation of additional separate channels (e.g., 30, 50 or 70) (see col. 14, lines 24 - 57; figure 3A).

Claim 65 is considered a process or intended use limitation. The Courts have held that a statement of intended use in an apparatus claim fails to distinguish over a prior art apparatus. See *In re Sinex*, 309 F.2d 488, 492, 135 USPQ 302, 305 (CCPA 1962).

Art Unit: 1743

Regarding claim 66, Handique does not specifically teach the incorporation of a plurality of separate reaction chambers or channels. The Courts have held that the mere duplication of parts, without any new or unexpected results, is within the ambit of one of ordinary skill in the art. See *In re Harza*, 124 USPQ 378 (CCPA 1960) (see MPEP § 2144.04). Therefore, it would have been obvious to a person of ordinary skill in the art to incorporate a plurality of chambers or channels as recited in claim 66.

Regarding claims 67 - 71, Handique teaches various microchannel dimensions, e.g., a microchannel depth of between 0.5 μ m to 50 μ m (see col. 7, lines 44 – 63). As shown in figure 3A, Handique teaches that the various channels can be arranged either parallel to each other or perpendicular to a common conduit comprising hydrophobic region 40.

2. Claims 16, 19, 22, 23, 25 – 29, 31, 36, 38, 41, 42, 44, 46, 64, 72 – 89, 92 – 96 and 98 – 100 are rejected under 35 U.S.C. 103(a) as being unpatentable over Handique, and further in view of Mian et al. (U.S. Pat. No. 6,709,869 B2) (hereinafter "Mian").

Regarding claims 16, 22, 19, 72 – 77, Handique does not specifically teach the use of a radial or circular substrate configuration for the analytical microfluidic apparatus. Mian teaches a radially-configured analytical microfludic apparatus, which relies on centripetal forces to facilitate sample transport and processing. The disclosed apparatus comprises various sample fluid inlet ports, microchannels, chambers/cavities, valves, heating/cooling elements, electrophoretic elements and detection systems upon a single disk for sample processing and analysis (see col. 3, line 25 – col. 4, line 42; col. 26, lines8 – 48). Mian teaches various pertinent apparatus structural dimensions (see col. 8, lines 14 – 50). As indicated by Mian, a person of ordinary skill in the art would have recognized the suitability of utilizing a radially-configured

Art Unit: 1743

analytical microfluidic apparatus. Hence, as evidenced by Mian, a person of ordinary skill in the art would accordingly have had a reasonable expectation for success in utilizing a radial configuration for the disclosed apparatus. The Courts have held that the prior art can be modified or combined to reject claims as *prima facie* obvious as long as there is a reasonable expectation of success. See *In re Merck & Co., Inc.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986) (see MPEP § 2143.02). Therefore, it would have been obvious to a person of ordinary skill in the art in utilizing a radial configuration for the disclosed apparatus.

Regarding claim 23, Mian teaches the incorporation of pneumatically-actuated membrane valves, which incorporate the use of a plunger or piston, and single-use valve structures (see col. 18, line 35 – col. 19, line 67). The use of single-use valves comprising breakable seals are well known in the art. Therefore, it would have been obvious to a person of ordinary skill in the art to incorporate such a valve system with the disclosed apparatus in order to facilitate effective sample fluid transfer.

Regarding claims 25 - 29, 31, 46, 78 & 79, Mian teaches the incorporation of a fluorescent, chemiluminescent and electrochemical detection means, which are well known in the art (see col. 7, lines 56 - 65; col. 21, line 29 - col. 24, line 37; col. 26, line 52 - col. 27, line 25).

Regarding claim 64, Mian teaches the use of pipettes for facilitating fluid transfer with the disclosed microfluidic apparatus (see col. 26, lines 8-48). Mian specifically teaches that the pipette tips fit into the access ports on the surface of the apparatus (see col. 26, lines 17-21). Therefore, it would have been obvious to a person of ordinary skill in the art to provide a molded

Application/Control Number: 09/937,690

Art Unit: 1743

inflow port or channel with the disclosed apparatus in order to facilitate effective sample fluid transfer.

Regarding claim 80, Mian teaches the incorporation of photomultiplier tubes (see col. 37, lines 48-63).

Regarding claims 33, 36, 38, 81 - 85, Mian teaches the incorporation of immobilized chemical reagents, such as antibodies, for sample analysis and processing (see col. 35, line 61 – col. 37, line 47).

Regarding claim 86, Mian teaches surface modification (see col. 14, lines 42 - 67).

Regarding claims 41 & 87, these claims are considered a product-by-process claims. The patentability of a product or apparatus does not depend on its method of production or formation. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process. See *In re Thorpe*, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (see MPEP § 2113).

Regarding claims 41, 42 & 88, Mian teaches that the substrate is made from various elastomeric polymer materials (see col. 14, lines 1-41).

Regarding claims 44 and 98 - 100, the use of polydimethylsiloxane (PDMS) as a fabrication material for microfluidic devices is well known in the art. Furthermore, the use of bonding and lamination fabrication processes using PDMS are well known in the art (see MPEP $\S 2144.03$). Therefore, it would have been obvious to a person of ordinary skill in the art to incorporate the use of PDMS as a fabrication material for the disclosed microfluidic apparatus.

Regarding claim 89, Mian teaches the use of an electromagnetic radiation detection means (see col. 22, line 1 - col. 23, line 28).

Regarding claims 54, 58, 92 - 96, Mian and Handique teaches all of the structure of the apparatus provided in the claimed method, which merely recites the conventional operation of that apparatus. Therefore, it would have been obvious to a person of ordinary skill in the art to perform the method recited in the instant claims, as such is the intended operation of that apparatus.

Response to Arguments

Applicant's arguments with respect to the present claims have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian J. Sines, whose telephone number is (571) 272-1263. The examiner can normally be reached on Monday - Friday (11 AM - 8 PM EST).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jill A. Warden can be reached on (571) 272-1267. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
